What error message did you encounter (if any)?

I got a compiler error saying the variable might not have been initialized because I forgot to set up my percentage variable correctly at the start.

What unexpected behavior did your program exhibit?

When I ran it, it asked for my percentage, but after I typed it in, nothing happened on the screen and it just froze.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

When I ran it, it asked for my percentage, but after I typed it in, nothing happened on the screen and it just froze.

Include a screenshot of specific lines of code.

```
System.out.print("The corresponding letter grade is:

if(percentage >= 90 && percentage <= 100) {
    System.out.println("A");
}else if(percentage >= 80 && percentage <= 89) {
    System.out.println("B");
}else if(percentage >= 70 && percentage <= 79) {
    System.out.println("C");
}else if (percentage >= 60 && percentage <= 69) {
    System.out.println("D");
}else {
    System.out.println("F");
```

How did you fix the issue?

I split the prompt (System.out.print) and the result display (System.out.println) into two separate lines so Java forced the text to show up right away after getting the input.

Provide the corrected code or solution using a screenshot.

```
<terminated> Grade [Java Application] C:\Program Files\
Enter the percentage: 74
The corresponding letter grade is: C
```
