What error message did you encounter (if any)?

I got a StringIndexOutOfBoundsException error at first when I tried to test an empty input for the last name before checking its length.

What unexpected behavior did your program exhibit?

When I entered a lowercase last name like "smith", the program skipped all the if conditions because it was checking against uppercase letters like 'J' and 'S

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

It was a logic error caused by case-sensitivity when comparing primitive char values

Include a screenshot of specific lines of code.

Got to write out this error log way after correcting my code, dont have a screenshot either..

How did you fix the issue?

I fixed it by wrapping the character extraction in Character.toUpperCase(lastName.charAt(0)) so that any lowercase letter gets converted to uppercase before the range checks run

Provide the corrected code or solution using a screenshot.

```
// make sure last name is not empty before checking its characters
if (lastName.length() > 0) {
    // Get the first letter of the last name and capitalize it for comparison
    char firstLetter = Character.toUpperCase(lastName.charAt(0));
```
