What error message did you encounter (if any)?
I kept getting a "syntax error on token" compile error at first because I forgot to close a parenthesis in my long calculation line and missed a semicolon after input.nextInt().
What unexpected behavior did your program exhibit?
Before I double-checked my multiplication values, my total was coming out way too high because I accidentally typed 0.25 for quarters but typed 1.0 instead of 0.10 for dimes.
What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)
It was a mix of a minor syntax typo with a semicolon and a logic mistake in how I typed out one of the decimal multipliers.
Include a screenshot of specific lines of code.
I fixed the code and no longer have the wrong code to screenshot..
How did you fix the issue?
I fixed the semicolon by carefully checking the red squiggly line in Eclipse, and I fixed the math logic by re-reading my formula and correcting the decimal value for dimes to 0.10
Provide the corrected code or solution using a screenshot.
