What error message did you encounter (if any)?
I got an "infinite loop" logic issue at first because I initially forgot to put userGuess = input.nextInt(); inside the while loop body, so userGuess stayed 0 forever
What unexpected behavior did your program exhibit?
When I guessed the secret number (4), the program printed "Hint: try a lower number" before printing "You won!".
What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)
It was a logic error inside giveHint() where I used separate if statements instead of else if, which caused the second check to evaluate unexpectedly.
How did you fix the issue?
I changed the condition inside giveHint() to an else if structure so only one hint condition triggers per turn, and placed an if (userGuess != secret) check in main() before invoking the hint method.
Provide the corrected code or solution using a screenshot.

```
public static void giveHint(int userGuess, int secretNum) {
    if (userGuess < secretNum) {
        System.out.println("Hint: try a higher number");
    } else if (userGuess > secretNum) {
        System.out.println("Hint: try a lower number");
    }
```

```
while (userGuess != secret) {
    System.out.print("Enter a number between 1 and 20: ");
    userGuess = input.nextInt();

    // If incorrect call method to display hint otherwise display win message
    if (userGuess != secret) {
        giveHint(userGuess, secret);
    } else {
```
