What error message did you encounter (if any)?

I got an error saying variable money might not have been initialized because I accidentally put int in front of money on every line when trying to calculate the coins.

What unexpected behavior did your program exhibit?

When I tested it with 212 cents, my quarters came out right, but my dimes, nickels, and pennies were completely messed up and showed huge numbers or zero.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

It was a logic error and a variable issue. I realized I wasn't updating my total money variable after subtracting quarters, so it kept calculating dimes out of the original 212 instead of the leftover balance.

Include a screenshot of specific lines of code.

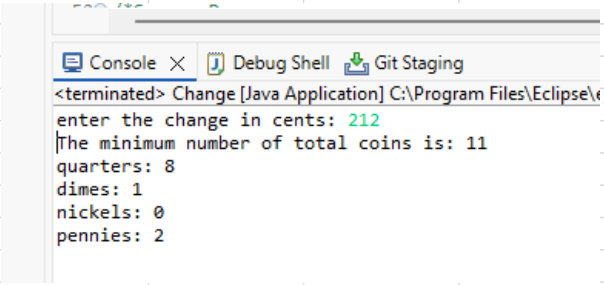
```
//calculate min number of coins
int quarters = money / 25;
money %= 25;

int dimes = money / 10;
money %= 10;

int nickels = money / 5;
money %= 5;
```

Im writing this error log after completion so im not sure how to have a screenshot of the wrong code

How did you fix the issue?

I used compound assignment operators (%=) instead of regular division. That way, whatever money was left over after taking out quarters automatically carried over to check for dimes, nickels, and pennies just like I planned.


Provide the corrected code or solution using a screenshot.
