What error message did you encounter (if any)?

I kept getting a Syntax error on token "int" compiler error at first because I accidentally tried to re-declare variables or missed a semicolon on the line above the math logic.

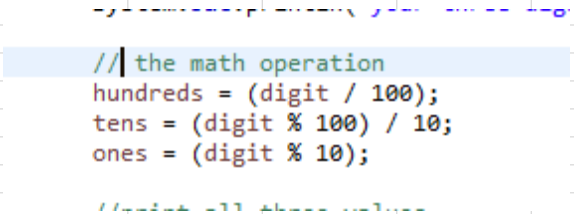
What unexpected behavior did your program exhibit?

Before I fixed my formula, my output for the tens place was giving me totally random numbers instead of the middle digit.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

It was a logic error. Like I wrote in my reflection, getting the tens place right was tricky because of how the math evaluates. I wrote digit % 100 / 10 without proper parentheses at first, so the computer wasn't calculating the remainder and division in the right order.

Include a screenshot of specific lines of code.

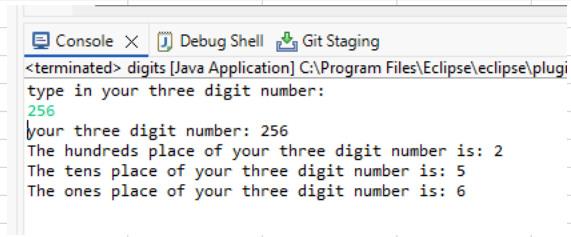


```
        // the math operation
        hundreds = (digit / 100);
        tens = (digit % 100) / 10;
        ones = (digit % 10);
```

How did you fix the issue?

I fixed it by fisrt asking my teacher to clear out where my mistake was, then I began breaking down the steps and wrapping the modulus part in parentheses like this: tens = (digit % 100) / 10;. That way, it strips the hundreds digit first before dividing by 10.

Provide the corrected code or solution using a screenshot.



```
Console  Debug Shell  Git Staging
<terminated> digits [Java Application] C:\Program Files\Eclipse\eclipse\plugi
type in your three digit number:
256
your three digit number: 256
The hundreds place of your three digit number is: 2
The tens place of your three digit number is: 5
The ones place of your three digit number is: 6
```
