What error message did you encounter (if any)?

I got a compilation error saying variable pricePerCopy might not have been initialized because I missed assigning a default base value (0.0) when declaring it at the top.

What unexpected behavior did your program exhibit?

When I tested borderline inputs, my code sometimes skipped pricing tiers or defaulted to the wrong rate because of overlapping conditional boundaries.

What caused the issue? (e.g., syntax error, logic error, incorrect function usage, etc.)

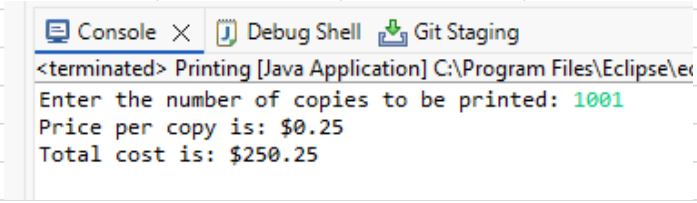
It was a logic and initialization error. I initially missed combining logical operators properly or set up my if-else brackets in a way that caused some numbers to fall through incorrectly.

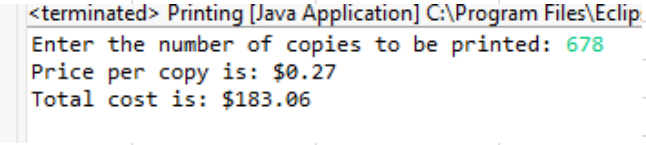
Include a screenshot of specific lines of code.

```
    //Determine price per copy based on quantity
    if(copies >= 0 && copies <=99) {
        pricePerCopy = 0.30;
    } else if (copies>=100 && copies <=499) {
        pricePerCopy=0.28;
    } else if (copies>=500 && copies <=749) {
        pricePerCopy=0.27;
    } else if (copies>=750 && copies <=1000) {
        pricePerCopy=0.26;
    } else if (copies>1000) {
        pricePerCopy=0.25;
    }

    //Calculate total cost
```

How did you fix the issue?

I initialized double pricePerCopy = 0.0; right at the start and carefully structured the if-else if conditions so every possible quantity range was clearly covered without gaps.




Provide the corrected code or solution using a screenshot.
